60 IMPORTANT PYTHON VIVA QUESTIONS (PRACTICALS)

1. What is Python?
Python is a high-level, interpreted, object-oriented programming language used for general-purpose programming.

2. Why is Python called an interpreted language?
Because Python code is executed line by line without compilation.

3. What are variables in Python?
Variables are used to store data values in memory.

4. What are Python data types?
Common data types are int, float, string, list, tuple, set, and dictionary.

5. What is type() function?
It is used to check the data type of a variable.

6. What is input() function?
It is used to take input from the user.

7. What is print() function?
It is used to display output on the screen.

8. What is a list?
A list is an ordered and mutable collection of elements.

9. What is a tuple?
A tuple is an ordered but immutable collection of elements.

10. Difference between list and tuple?
List is mutable, tuple is immutable.

11. What is a dictionary?
A dictionary stores data in key-value pairs.

12. What is a set?
A set is an unordered collection of unique elements.

13. What are keywords?
Keywords are reserved words with predefined meanings.

14. What is indentation?
Indentation defines the block of code in Python.

15. What is a function?
A function is a block of reusable code.

16. What is def keyword?
It is used to define a function.

17. What are arguments?
Arguments are values passed to a function.

18. What is return statement?
It returns a value from a function.

19. What is recursion?
A function calling itself is recursion.

20. What is a loop?
A loop is used to repeat a block of code.

21. Types of loops?
for loop and while loop.

22. What is break statement?
It exits the loop immediately.

23. What is continue statement?
It skips the current iteration.

24. What is pass statement?
It is a null statement doing nothing.

25. What is conditional statement?
Used to make decisions using if, elif, else.

26. What is if statement?
Executes code when condition is true.

27. What is elif?
Checks multiple conditions.

28. What is else?
Executes when all conditions fail.

29. What is class?
A class is a blueprint for objects.

30. What is object?
An instance of a class.

31. What is __init__ method?
It initializes object data.

32. What is self keyword?
It refers to the current object.

33. What is inheritance?
One class acquiring properties of another.

34. What is polymorphism?
Same function name with different behaviors.

35. What is encapsulation?
Wrapping data and methods together.

36. What is abstraction?
Hiding internal details.

37. What is exception?
An error that occurs during execution.

38. What is try-except?
Used to handle exceptions.

39. What is finally block?
Always executes whether exception occurs or not.

40. What is file handling?
Used to read and write files.

41. Modes of file handling?
read, write, append.

42. What is open() function?
Used to open a file.

43. What is close() function?
Closes the file.

44. What is with statement?
Used for automatic file closing.

45. What is module?
A file containing Python code.

46. What is import keyword?
Used to import modules.

47. What is package?
A collection of modules.

48. What is pip?
Python package installer.

49. What is lambda function?
An anonymous function.

50. What is map() function?
Applies function to all items.

51. What is filter() function?
Filters elements based on condition.

52. What is reduce() function?
Reduces sequence to single value.

53. What is slicing?
Extracting a portion of sequence.

54. What is index?
Position of element.

55. What is len() function?
Returns length of object.

56. What is global variable?
Accessible everywhere in program.

57. What is local variable?
Accessible only inside function.

58. What is virtual environment?
Isolated Python environment.

59. What is IDE?
Integrated Development Environment.

60. What is Python used for?
Web, AI, ML, Data Science, Automation.
